SOLANA MOBILE HACKATHON 2025

VESTIGE

Fair-launch token trading with an inverted bonding curve — built natively for Solana Mobile.

SOLANA DEFI MOBILE-FIRST

RAYDIUM CPMM

THE PROBLEM

Token launches are broken.

Insider-heavy launches, bot-driven rug pulls, and zero mobile UX leave retail traders with no fair entry point.

~80%

of meme coins on pump.fun are abandoned within 48 hours

$2B+

lost to rug pulls and insider dumps in 2024 alone

0

major native Solana Mobile token-launch apps exist today

THE SOLUTION

An inverted bonding curve that rewards early holders.

Vestige starts tokens at their **maximum price** and decreases it as supply is sold — creating a built-in incentive for early participation and eliminating the insider advantage.

Once the SOL graduation target is hit, the token **graduates automatically to Raydium CPMM** — giving it real on-chain liquidity.

MECHANISM

How It Works

01 **Creator Launches a Token** — LAUNCH

Sets name, symbol, supply, and the graduation SOL target. Token starts at pMax.

02 **Traders Buy & Sell via Bonding Curve** — BUY / SELL

price = pMax − (pMax − pMin) × (totalBaseSold / supply). Every buy pushes cost down for the next buyer.

03 **Live Price Feed & Trade History** — CHARTS

Candlestick chart, bonding curve visualization, and real-time trade feed parsed from on-chain logs.

04 **Automatic Raydium Graduation** — GRADUATE

When totalSolCollected ≥ graduationTarget, liquidity is seeded into Raydium CPMM automatically.

PRODUCT

Built for traders on the go

Bonding Curve Chart

Real-time SVG visualization of the inverted curve with a live position dot.

Candlestick Charts

Custom OHLC candles aggregated from on-chain transaction logs.

Live Trade Feed

Parsed buy/sell events streamed from Solana logs in real time.

One-Tap Launch

Create and launch a token in seconds from a Solana Mobile device.

Auto Graduation

Automatic Raydium CPMM seeding when the SOL target is reached.

Mobile-Native

React Native with Solana Mobile SDK — hardware wallet signing on-device.

ARCHITECTURE

Fully on-chain, fully mobile

On-Chain (Solana)

- Anchor framework — Rust programs
- Custom inverted bonding curve logic
- Raydium CPMM graduation CPI
- On-chain log emission for trade events
- BN arithmetic for lamport precision

Mobile (React Native)

- Solana Mobile SDK (MWA)
- React Native + TypeScript
- Custom SVG candle + curve charts
- Real-time log parsing & candle aggregation
- Auto-refresh every 15 / 30 seconds

OPPORTUNITY

A massive, underserved market

SOLANA DEX VOLUME

$40B+

Monthly on-chain volume across Solana DEXs in early 2025

PUMP.FUN LAUNCHES

4M+

Tokens launched on pump.fun since 2024 — demand is proven

SOLANA MOBILE USERS

~200K

Saga + Chapter 2 device owners — zero native launch apps exist

Vestige captures the intersection of **fair-launch demand**, **Solana DeFi growth**, and the **untapped Solana Mobile ecosystem** — a vertical no competitor is targeting natively.

ROADMAP

What's next for Vestige

✓ COMPLETE

Foundation

- → Anchor bonding curve program
- → Mobile buy / sell UI
- → Price + candle charts
- → Raydium graduation CPI

▶ NOW

Hackathon MVP

- → Live trade feed
- → Create launch screen
- → Portfolio view
- → Mainnet beta

Q3 2025

Growth

- → Creator analytics
- → Social trading feed
- → Push notifications
- → Token metadata CDN

Q4 2025

Scale

- → Multi-chain support
- → Revenue share for creators
- → SDK for third-party launchpads
- → DAO governance

SEED ROUND

$500K

to take Vestige from hackathon MVP to the #1 fair-launch app on Solana Mobile.

40%	30%	30%
Engineering — 2 senior Solana devs	Growth & community incentives	Security audits & infrastructure
